Davide Pintore

UX/UI & DIGITAL PRODUCT DESIGNER

"I design digital experiences that reduce complexity and respect how people actually work."

Hybrid background in computer science, visual design, and front-end development. I design interfaces and digital systems with a focus on clarity, scalability, and reducing cognitive load — integrating AI tools into the process when they help accelerate exploration and iteration.

✉ davide.pintore98@gmail.com · Italy, Tuscany · Portfolio · LinkedIn · GitHub

1 About Me

My path into design wasn't linear. I started with Computer Science, moved into Graphic Design, and found my home in UI/UX and digital product design — where analytical thinking meets human empathy.

I approach every project by listening first: interviews, observations, data. Only after understanding the real problem do I design solutions. What drives me is turning complex systems into clear, intuitive experiences — whether that means restructuring an information architecture or crafting a pixel-perfect interface.

I completed two intensive UX/UI programs (Boolean, 5 months; Masamune, 6 weeks), was selected for a paid engagement straight out of training, and then pitched and delivered my first freelance project: the new website of a Tuscan restaurant, from research to live code.

2 How I Work

I believe good design is evidence-based. My process follows a research-first approach: I validate assumptions before committing to solutions.

I work comfortably in Agile Scrum environments — running sprints, participating in stand-ups and retrospectives, and iterating based on real feedback. I build scalable Design Systems using Atomic Design principles, ensuring every component has a clear purpose and every decision is traceable.

3 Skills & Area of Expertise

UI Design
- Design Systems (Atomic Design)
- UI Kits
- Visual Design
- Responsive Design
- Interactive Prototyping

UX Research
- Qualitative Interviews
- Surveys
- Usability Testing
- Benchmark Analysis
- Personas
- Journey Mapping

UX Design
- Information Architecture
- User Flows
- Wireframing

Development
- HTML
- CSS
- JavaScript
- TypeScript
- React
- Next.js
- Tailwind CSS
- Framer Motion
- GSAP
- Playwright

Tools
- Figma
- Miro
- Maze
- Adobe Creative Suite
- VS Code
- Sanity (CMS)
- Stripe
- Claude Code
- Figma MCP
- NotebookLM

Methods
- Agile Scrum
- Design Thinking
- Double Diamond
- User-Centered Design (UCD)
- Jobs To Be Done (JTBD)
- Lean UX

4 Education & Certifications

2026 **Boolean Tech Academy**
UX/UI Designer Certificate (5 months, intensive course with real project final work).

2026 **Masamune Academy**
UX/UI Designer Certificate (6 weeks, intensive full-time training with real clients and Agile Scrum framework).

2024 **Coursera**
Meta Front-End Developer Certificate (HTML, CSS, JS, and React fundamentals).

2022 **Academy of Fine Arts Santa Giulia, Brescia**
BA in Graphic Design (Visual communication, typography, branding, and editorial design).

2019 **ITIS Leonardo Da Vinci, Pisa**
Diploma in Computer Science (Logic, algorithmics, database systems, networking).

5 Case Study: Via di Guinceri

"Via di Guinceri — Born From a Dream, Built to Work"

ROLE	DURATION	METHOD
UX/UI Designer & Front-end Developer	6 Weeks	Freelance (Paid Engagement)

Via di Guinceri is a dry-aged meat restaurant in the Tuscan hills. Nobody asked for this project: I pitched it myself, with a video comparing the old website with a first proposal, and won a paid freelance engagement to start again from zero.

The old site had 17 pages in Italian plus 12 English copies, 21 plugins and three stacked pop-ups. I audited it (126 findings), interviewed the people who work at the restaurant and studied how restaurant sites are used. The owner's brief was simple: booking everywhere, never something you have to look for.

I restructured the information architecture from 17 pages to 10, each in four languages (IT, EN, FR, DE), and built a Design System in Figma (9 colors, 10 text roles, an 8 px grid), fixing three contrast failures to meet WCAG 2.1 AA. Through Figma's MCP connection the system was carried into code (Next.js, React, TypeScript, Tailwind CSS) with Claude Code as an assistant, then reconciled back to Figma component by component.

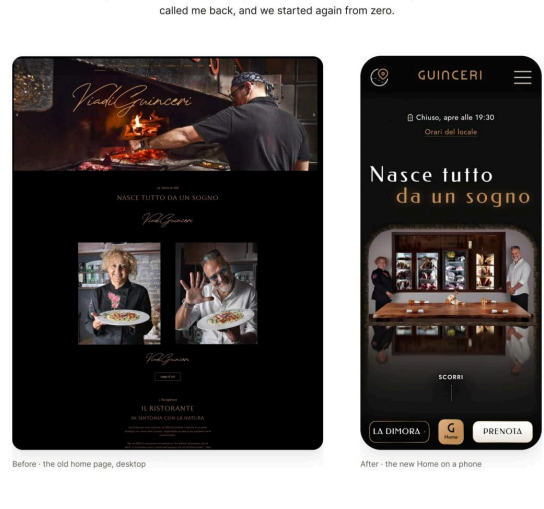
Behind the public site there is a staff portal: bookings with online deposits and automatic refunds, gift vouchers generated with a unique code and QR, closures that update the whole site at once, and statistics without cookies, with every money action confirmed by a passkey. The restaurant edits its own texts, menu and prices through Sanity.

Everything was tested with 19 automated checks on 17 phone sizes. Six weeks from the first sketch to a live site: viadiguinceri.it.

The Pitch

Nobody asked me for this project.

Nobody asked me for this project. I recorded a 15-minute video for Fabrizio, the owner of Via di Guinceri, a dry-aged meat restaurant in the Tuscan hills. In it I walked through their old website next to a first proposal, and explained how much more the place could show online. A few days later he called me back, and we started again from zero.



GUINCERI
Nasce tutto

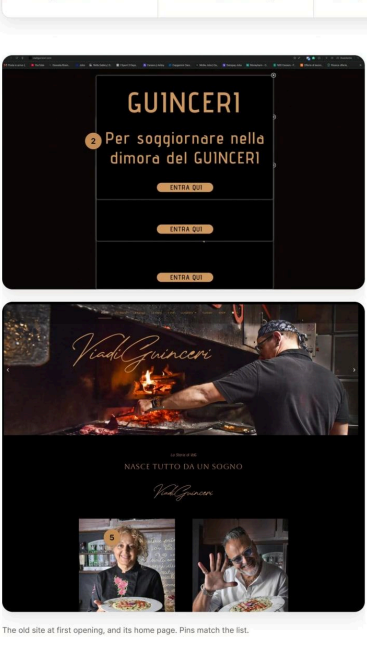
After · the new Home on a phone

What Was in the Way

I started with an audit of the old site: 126 findings, grouped by what they cost the guest.

29	21	3	0
Pages for one goal: a booked table	Plugins for a restaurant with one goal	Stacked pop-ups on every visit	Sitemaps no meta descriptions either



GUINCERI
Per soggiornare nella dimora del GUINCERI

The old site at first opening, and its home page. Pins match the list.

1. 29 published pages, 12 of them English copies, and 21 plugins for a restaurant with one goal: a booked table.
2. Three stacked pop-ups on every visit, made of images with the text baked in. Three taps to reach the home page, and nothing a screen reader could read.
3. Two "Book" buttons on the same page, leading to two different external platforms.
4. Opening hours only in the footer of a gallery sub-page. No map.
5. No sitemap, no meta descriptions, no structured data, no alt text on 37 photos.

Information Architecture

17 pages became 10, each in four languages.

The old site had 17 pages in Italian and 12 English copies, 29 in all. The new one has 10, each in Italian, English, French and German. About us, the brigade and four gallery pages merged into the Home. Contacts moved into Booking, where people actually look for them. Every old address redirects to its new page, so no link in the wild breaks.

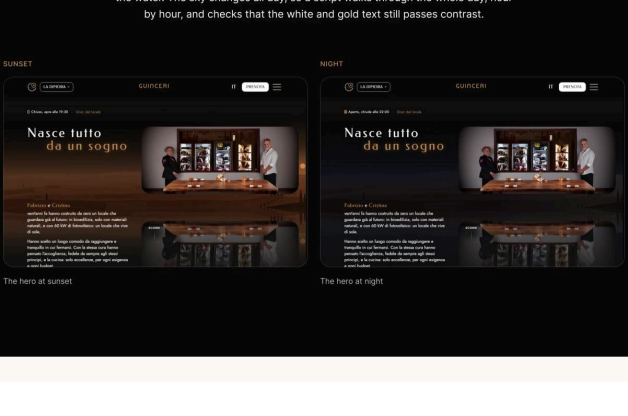
The Home: a Landscape on Real Time

"Nasce tutto da un sogno", it all starts from a dream.

"Nasce tutto da un sogno", it all starts from a dream, was the owners' line. I turned it into a Tuscan landscape drawn in code that follows the real time of day at the restaurant: the sun is calculated with astronomical formulas, the moon rises at night, the windows of the village light up one by one at dusk.

Fabrizio and Cristina's photo floats above a lake, and the reflection is calculated, not faked: camera height, distance of each hill, the Fresnel effect, the colour of the water. The sky changes all day, so a script walks through the whole day, hour by hour, and checks that the white and gold text still passes contrast.



SUNSET

Behind the Counter

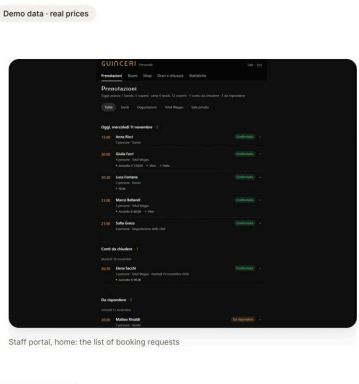
The part guests never see, and the part that changed the most for the restaurant.

The staff portal is the part guests never see, and the part that changed the most for the restaurant. Every money action is confirmed with the phone's fingerprint or face.

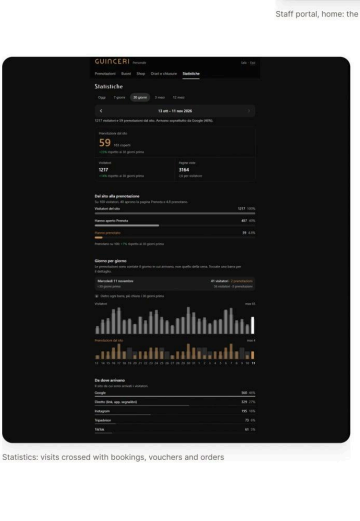
Demo data · real prices

Bookings

Requests arrive in one list. Confirm, decline, or reply in one tap. Tasting menus take a deposit online; at the end of the night the site calculates what the guest still owes and refunds the difference.



Staff portal, home: the list of booking requests



Statistics: visits crossed with bookings, vouchers and orders

Statistics

Site visits crossed with bookings, vouchers and orders, without cookies.

Gift Vouchers, Generated on Their Own

Nobody has to issue anything by hand.

A guest buys a tasting menu for a number of people, or a free amount, and pays online. The site creates the voucher by itself: a unique code, a PDF with a QR code, sent by email to the guest and to the restaurant. At the table the staff scan the QR with a phone and mark it used, all at once or in parts. A lost voucher gets a new code; the guest can withdraw within 14 days; it is valid for a year. Nobody has to issue anything by hand.

1. **Bought online** — A tasting menu for a number of people, or a free amount
2. **Created by the site** — A unique code, a PDF with a QR code
3. **Sent by email** — To the guest and to the restaurant
4. **Scanned at the table** — Marked used, all at once or in parts

Vouchers in the staff portal

How I Worked

AI as an assistant, not a pilot: it suggests, I decide.

I designed and directed everything, and I wrote the code with an AI coding assistant. AI as an assistant, not a pilot: it suggests, I decide.

Nothing goes live untested. Since launch, every change is built on a separate development branch with its own preview site, reviewed and approved, and only then merged into the live site.

Development branch → Preview site → Review & approval → Live site

Structured reviews. A code review before every commit. 19 automated checks, from the voucher maths to the contrast of the sky. A script that tests 17 phone sizes. Once, a full review with 16 AI reviewers and 5 independent verifiers produced 119 confirmed issues, 3 of them blocking, all fixed in four rounds. It gave me a wider eye on what I could have missed.

16 AI reviewers + 5 independent verifiers

119 confirmed issues

3 of them blocking

All fixed in four rounds

Outcome

The staff stopped doing by hand what the site now does on its own.

43	19	17	119
Days 29 Sep to 10 Nov 2026	Automated checks from the voucher maths to the contrast of the sky	Phone sizes tested by one script	Issues fixed 3 of them blocking, in four rounds

Six weeks from the first sketch to a live site with its own booking, shop, vouchers and staff portal. The staff stopped doing by hand what the site now does on its own.

6 Case Study: FisioGest

"FisioGest — From Research to Working Product"

ROLE	DURATION	METHOD
UX/UI Designer & Front-end Developer	1 Month (Part-time)	Agile Scrum (Paid Engagement)

FisioGest was my first paid professional engagement — four of us were selected right after the Masamune program to design and develop a management platform for physiotherapy clinics. This project was more vertical than ClinicSoul: I owned the entire journey from user research to front-end code.

We started by interviewing physiotherapists and osteopaths to understand their daily operations, pain points, and unmet needs. We clustered and analyzed interview data (notes and audio recordings) using AI-assisted analysis, then synthesized findings into a pain map that visualized where the biggest friction points lived.

From there, we designed the complete information architecture, user journey maps, and a full set of mockups covering all key pages and functions. I also built a Design System to ensure consistency across the product.

What made this project special was the end-to-end ownership: after the design phase, I contributed directly to the front-end development, bringing the product from wireframes to a working application. Working in weekly Scrum sprints with full ceremonies (stand-ups, reviews, retrospectives), I experienced what it means to ship a real product under real constraints.

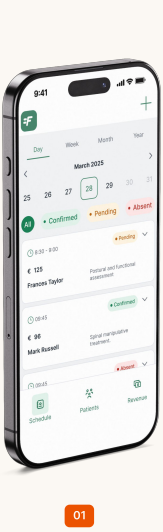
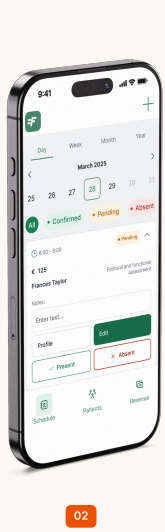
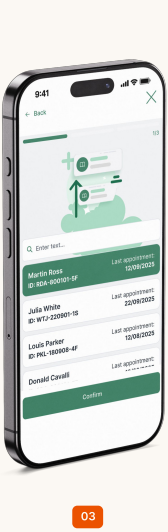
IDEATION



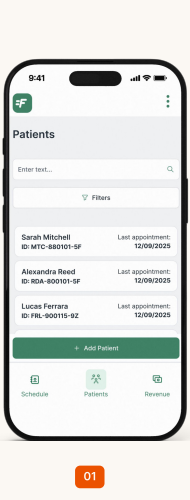
01
Card List
Calendar overview
Card view maximizes scanability and one-handed use. Essential info is front and center.



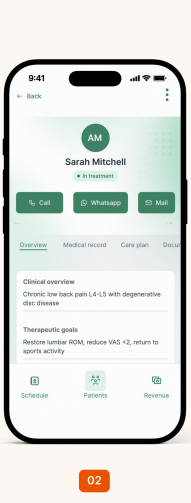
02
Progressive Disclosure
Appointment
Use of accordions and Progressive Disclosure to reveal notes and quick CTAs (WhatsApp/Profile) without losing list context.



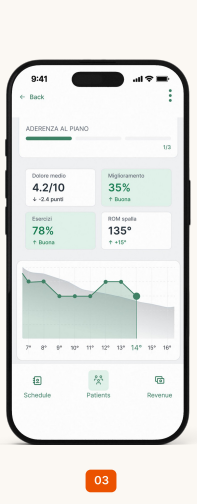
03
Immediate Feedback
New Appointment
Instant visual feedback reassures users that reminders are automated, reducing forgetfulness anxiety.



01
QUICK ACCESS
Patient List
Predictive search (by name or tax code) and advanced demographic filters for instant directory scanning and retrieving medical history in seconds.



02
INTUITIVE NAVIGATION
Patient Profile
Five-tab thematic layout to reduce cognitive load. Direct CTAs for "Call" and "WhatsApp" integrated for immediate patient follow-up.



03
MOTIVATIONAL SUPPORT
KPIs and Pain Map
Track progress with VAS charts and improvement indicators (%). Clinical trend visualization boosts patient awareness and therapy adherence.

7 Case Study: ClinicSoul

"ClinicSoul — Validating an AI-built product through UX Research"

ROLE	DURATION	METHOD
UX Researcher	6 Weeks	Agile Scrum

ClinicSoul was a clinical management platform that had been built almost entirely through AI-assisted ideation and internal assumptions — without any structured UX research. My team's challenge wasn't to design something new from scratch. It was to understand whether the existing product solved the right problems.

What we found was striking: the AI had hallucinated entire workflows that didn't match how doctors, receptionists, and clinic owners actually work. Features were misaligned with real clinical processes, the information architecture was confusing, and terminology created ambiguity rather than clarity.

I conducted 4 semi-structured interviews with clinic owners, practitioners, and receptionists, plus a survey with 23 participants. Through interactive Figma prototype walkthroughs, we mapped end-to-end patient flows and extracted direct user evidence.

Key insights emerged around three themes: naming and visual clarity (users found the terminology confusing), flexibility (clinics needed the software to adapt to their workflows, not the other way around), and system guidance (professionals expected proactive support rather than rigid automation).

Based on these findings, I restructured the entire Information Architecture into a flat, intuitive hierarchy built around 5 core operational pillars — all directly accessible from the dashboard. I also conducted a benchmark analysis against 5 competitors (XDENT, Alfadocs, Cliniko, MioDottore, Doctolib).

CLINICSOUL • UX ARTIFACT

ClinicSoul Insights

UX RESEARCH OUTPUT

NAMING & VISUAL CLARITY

Terminology consistency
The distinction between 'appointments' and 'visits' creates ambiguity when reading both the clinical record and the calendar.

Color as operational code
Colors are used as a functional code to quickly interpret the schedule, not as a purely aesthetic element.

Information hierarchy > features
Professionals value clarity of structure and navigation more than the sheer volume of available features.

From 'startup' to 'trust' look
An aesthetic perceived as too futuristic clashes with expectations of seriousness and stability in medical contexts.

FLEXIBILITY & ADAPTABILITY

Different roles, different priorities
Different roles (owner, doctor, receptionist) require distinct information priorities and views, not a single neutral interface.

Data legal integrity
Users expect the system to strictly enforce accounting rules and prevent non-compliant operations.

Flexibility as a top priority
Clinics expect the software to adapt to existing practices; overly rigid flows are perceived as obstacles.

Digital acquisition
Need to quickly integrate documents and images from mobile devices into the medical record.

SYSTEM GUIDANCE & SUPPORT

Smart filters
Professionals expect active support in preventing errors related to allergies, intolerances or clinical conditions.

Preserving the human touch
Strong focus on keeping human relationships central, with AI as backstage support rather than the main point of contact.

AI as assistant, not pilot
AI is perceived positively when it provides optional suggestions without removing control and visibility from the user.

Availability visualization
Need for a richer calendar view that shows availability, absences and overlaps to make rescheduling easier.

8 Case Study: Lume

"Lume — Making Energy Bills Understandable"

ROLE	DURATION	METHOD
Lead UX/UI Designer	5 Months	Coordinated Team / Research

Lume was a smart energy management app commissioned by IMILLE studio. The problem was clear: people don't understand their energy bills. Terminology is cryptic, data is hidden, and there's zero perception of how much they could actually save.

As Lead Designer in a team of 3, I guided the entire research and design process. We started with a mixed-methods approach: a survey distributed to 77 users gave us the quantitative landscape, while 8 in-depth 1:1 interviews revealed the emotional frustrations behind the numbers. Benchmarking and usability testing on competitors showed us where existing solutions fell short.

The solution centered on three pillars: a real-time dashboard that makes consumption data immediately readable, a gamification system with savings challenges that make the abstract tangible, and educational tooltips that demystify technical terminology (like the difference between electricity and gas billing cycles).

We also created Lume's mascot character to give the brand a friendly, approachable personality — reinforcing that energy management doesn't have to feel intimidating.

I coordinated deadlines, facilitated design decisions, and supervised the final UI delivering a complete Design System that ensures scalability, consistency, and WCAG 2.1 AA accessibility (color contrast, touch target sizing, visible focus states).

LUME • UX ARTIFACT

Research Data

UX RESEARCH OUTPUT

Qualitative & Quantitative findings from user research

8	77	30–55
Interviews	Surveys	Age Range

KEY INSIGHT

Users don't want less data. They want data that is clearer and more understandable.

Qualitative Research — 8 interviews

01 They only look at the amount and due date

02 Technical language generates distrust

03 6 out of 8 users do not provide meter readings

04 Saving is seen as a sacrifice

Quantitative Research — 77 surveys

"If you could change ONE thing about the bill reading/management experience, what would it be?"

25%	22,6%	16,1%	6,5%
Clarity & simplicity	Other (spontaneous)	Better graphics & UX	Cost breakdown

22.6% answered "other", spontaneously mentioning:
- Desire to pay by card
- Real-time consumption view
- Removal of costs like the TV license fee
- Benefits for long-term customers

Insights

1. **The bill causes anxiety**
Users only look for the final amount.
2. **Numbers are perceived as complex**
Technical charts are not understood without context.
3. **Meter reading is seen as a chore**
It is not a spontaneous action but a stressful task.
4. **People want to save, but don't know where to start**
There is intention, but no direction.
5. **Saving is more motivating when visible over time**
Users respond better to progress than punishment.

What Users Desire

- Simple, readable charts and the ability to compare (month vs month, €/kWh)
- View data in real time
- Greater incentives for positive behaviors regarding sustainability/savings
- Desire to understand better
